Recommended: Voyage 4 Large

Voyage 4 Large ranks first with MRR 0.828 and recall@5 94.0%. It leads Voyage 4 by +0.013 MRR and, question by question, ranks a relevant chunk higher on 8 questions, lower on 7, with 85 ties.

Ranking rule: MRR, then recall@5. Failed configurations are listed last.

Q48 How do web beacons work, and what kinds of data may mobile identifiers allow analytics and advertising partners to collect?

Expected chunk

#6825 Web beacons are electronic images (also called “single-pixel” or “clear GIFs”) that are contained within a website or email. When your browser opens a webpage or email that contains a web beacon, it automatically connects to the web server that hosts the image (typically operated by a third party). This allows that we…

Metric definitions

Hit rate@k	Share of questions with at least one expected chunk among the k retrieved chunks.
Recall@k	Share of a question's expected chunks found in the top k, averaged over questions.
Precision@k	Relevant chunks retrieved divided by k, averaged. With one expected chunk per question it cannot exceed 1/k.
F1	Harmonic mean of precision@k and recall@k per question, averaged.
MRR	Mean reciprocal rank: 1 / rank of the first relevant chunk (0 when missed), averaged.
nDCG@k	Discounted cumulative gain with binary relevance, normalised by the ideal ranking.
Score gap	Best relevant similarity minus best distractor similarity, averaged over questions that retrieved both.
Latency	Question embedding time (batched, averaged per question) and vector search time per question (mean, p50, p95).
Index cost	Corpus tokens x model price per 1M tokens: the cost of embedding every chunk once.

Cost per 1k queries	1,000 x the golden set's average question tokens x model price per 1M tokens, plus the reranker's price for 1,000 queries when one is used.
Vector storage	Chunks x dimensions x 4 bytes (float32), excluding the vector database index overhead.

Notes

- Every question is embedded with the evaluated model and searched against an index of the whole project corpus embedded with the same model. With hybrid search, a BM25 keyword ranking of the same chunks is fused with it (reciprocal rank fusion); with a reranker, the first-stage candidates are re-scored and the top k kept.
- Relevance is binary: a retrieved chunk is relevant when its id is one of the expected chunk ids of the golden-set entry.
- Configurations are ranked by MRR, then recall@5; every configuration is evaluated on the same questions and the same top k.
- Costs are estimates from token counts and the list prices of each model and reranker at run time; they exclude vector database hosting.
- Latency depends on the provider, network and hardware at the time of the run and is indicative only.
